Your courses, turned into islands you explore

Upload your slides and notes. Each course becomes an island with five places to learn — quizzes, a tutor that asks you questions back, flashcards, audio and a forum to explain ideas to your class.

Start exploring →

Free to start. Hints, not answers.

Quiz Hall · Socratic Tutor · Study Studio · Audio Studio · Teach-Back Arena

QUESTION 2 OF 4

You're learning a new formula. You'd rather...

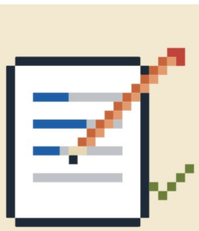

Pick the one that feels most like you. There's no wrong answer, and you can change it later.

Selected

See it as a diagram

Draw it out so I can see where each part comes from.

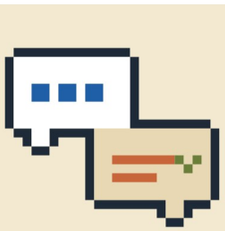

Try a few examples

Give me three problems and let me get my hands dirty.

Hear it explained

Talk me through it, like a podcast on the way to class.

Explain it to a friend

I only really get it once I've said it out loud.

Class Wisdom

From anonymous mistakes in Engineering 2B

3 classmates mixed up the limit and the derivative here. The limit asks where f(x) is *heading* as x gets close to a. The derivative asks how *fast* f is changing at a.

Names are hidden. Only the pattern is shared.

Show me another tip

Evaluate the limit

$$\lim_{x \to 2} (x^2 - 4) / (x - 2) = ?$$

A 0

B 2

C 4

D It doesn't exist, because we get 0/0 — Your answer

Not quite, but you're close.

Plugging in $x = 2$ gives 0/0. That doesn't mean the limit is missing. It's a signal to simplify first.

Hint

Factor the top: $x^2 - 4 = (x - 2)(\ldots)$. Which factor cancels with the bottom, and what's left when x gets close to 2?

Try again · 2nd try | Hint shown

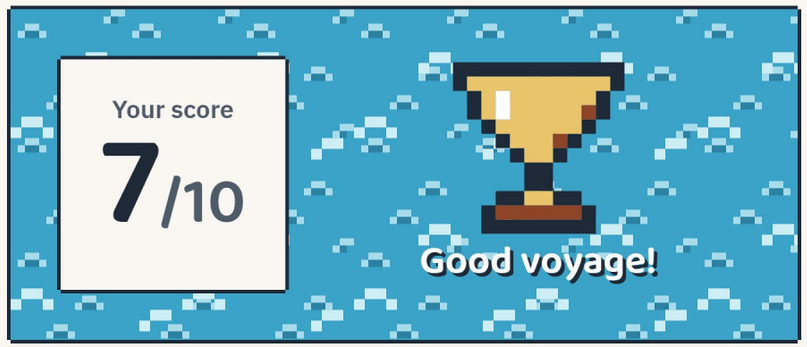

Skip this question

Hints are free. A correct second try still earns half the points.

Offline demo mode – showing saved results. New quizzes need a connection. We'll sync your coins when you're back online.

YOUR NEXT STEP

Your weak spot is limits → try the Socratic Tutor. It'll ask you questions until the 0/0 trick clicks.

Go to the Socratic Tutor 3

Back to the island

3 things to look at again

Turn these into flashcards

Q2 **Is f(x) = |x| / x continuous at 0?**

You said yes. The left and right limits are −1 and 1, so they don't match and there's a jump at 0.

Q4 **lim x→2 of (x² − 4)/(x − 2)**

Right on your second try: 4. Remember, 0/0 means "simplify", not "no limit". Half points.

Q8 **lim x→0⁺ of 1/x**

You picked 0. As x shrinks from the right, 1/x grows without bound, so the limit is +∞.

7 correct: **polynomial limits**, **squeeze theorem**, **limits at infinity** and more. Nice work.

Can you just tell me what lim x→0 of sin(x)/x is? The exam is Thursday.

I could, but let's make it stick before Thursday. If you plug in $x = 0$, what do you get? Does that give you the answer?

0/0... so I can't just plug it in.

Exactly. So let's sneak up on 0 instead. Try $x = 0.1$ and $x = 0.01$ on your calculator (in radians). What do you get?

0.9983 and 0.99998

Nice. Two questions for you:
1. What number are those values creeping towards?
2. Picture the graph of sin(x) very close to 0. What simple line does it look almost exactly like?

Give me a hint | Explain it another way | Show me the graph

Type your thinking, even if you're not sure...

I'm stuck | Send →

SESSION GOAL

Understand why sin(x)/x heads to 1

Hints used 1 of 3

Ideas you've found

- 0/0 means "look closer", not "no answer"
- Testing values near 0 shows the trend
- Why the graph of sin(x) hugs y = x

The tutor asks questions instead of giving answers. Tap "I'm stuck" any time for a smaller step.

Why does a stack make “undo” easy?
MintTea99 · 4 answers

When is a linked list better than an array?
BlueDoor7 · 2 answers

What does O(log n) really mean for binary search?
JasmineByte · No answers yet

Is a queue just a stack backwards?
OliveOwl · 1 answer

Ask the class a question

Why does a stack make “undo” easy?

Pinned best answer — OliveOwl — 92/100 — Confidence: high

Every action you do gets pushed on top of the stack. Undo just pops the top one, and that’s always the most recent action. Since a stack is last-in, first-out, you undo things in exactly the reverse order you did them.

Marked helpful by 6 classmates

SeaTurtle42 (your answer) — +5 · helpful ×2

74/100 AI score — Confidence: medium

A stack keeps your actions in the order you did them, so undo can find them quickly. When you press undo it removes the first action you did, then the next one. It’s like a queue at the bank, everything waits its turn.

2 things to fix

- Undo removes the **most recent** action, not the first one. A stack is last-in, first-out (LIFO).
- A bank queue is first-in, first-out. That’s the opposite structure. Try a stack of plates instead.

Good: you linked the order of actions to how undo works.

Card 12 of 20

4 new · 6 learning · 10 review

What does f′(a) measure?

Answer

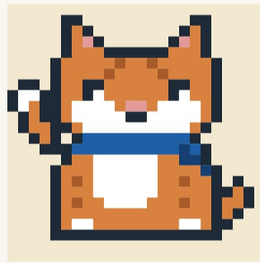

How fast f is changing at the point a.

It’s the slope of the tangent line to the graph at x = a, the limit of (f(a + h) − f(a)) / h as h → 0.

How well did you know it?
